Hmong, I'm amazed by your findings. I also found out that the average American person only uses about ten percents of his/her whole (I suppose that's both left and right) brain. Assuming if one were a left brainer, can we conclude that he/she only uses five percents of the brain? Adding to Hmong's tips of using the brain: 1. When you fall out of bed in the morning, touch the floor with the opposite foot first and do the same as you climb to bed. 2. Try wearing your shirt or pants by slipping your left hand or left leg first if you are right handed and left legged. 3. Try kissing your spouse or partner in an unusual way once in a while. 4. Try watching a movie with one eye - whichever you feel is being left out. 5. Try everything out of the ordinary, if it does not improve your whole brain - then take a hammer and pound on it really hard! :-)
